# Corrosion Prevention Material Case History

## Clean and Corrosion Protection: Various Construction Equipment

**DATE:** October 2014

**PROBLEM:** The construction equipment is dirty and showing signs of aging and decreased value. In the construction industry, much of the equipment is either leased or sold used. The use of polishes and waxes were a temporary solution to the appearance. How can the equipment owners extend the life of their equipment and keep the appearances looking good.

**APPLICATION:** A highly trained Corrosion Control Team (C2T) performs a power washing and cleaning removing all dirt, grease, and other debris. This returns the appearance to a much better look, sometimes to near new.

Once the piece of equipment is cleaned, it is then serviced by the technician using the corrosion prevention compound specifically selected for that particular application. Each piece of equipment has susceptible areas for corrosion and those are targeted for servicing. By doing only the areas specific for that piece, materials and time are most economically used.

The C2T performs its services at the location of the equipment with little to no interference with the day to day operations of the site.

**SOLUTION:** The C2T service returns the piece of equipment to a clean appearance and applied a clear corrosion prevention compound to the specific corrosion prone areas. These enhancements will add to the resale value of the equipment while extending its useful service life.
